ABSTRACT

The current system used at Junbee Garilva Recreation Center, Concepcion, Iloilo, is a manual-based system. The system process is encoded into the Log-Book. The customer records are saved individually and can be retrieved weekly. The records are inputted manually in the Log-Book by the Junbee Garilva Recreation Center. This system makes transactions hard for the customers.

On the other hand, there is an alternative solution that is proposed. This is computer-based technology known as the Online Reservation System for Junbee Garilva Recreation Center. This proposed system was designed to be fast, user friendly and easy to learn. The N-Tier architectural design was used as framework of the system that can be launched in a client and server environment.

Findings showed that there is a difference between the current system and the proposed system in terms of performance and accuracy of information produced.
